# Foundations of Software Fall 2022

Week 7

#### Plan

PREVIOUSLY: unit, sequencing, let, pairs, tuples

#### TODAY:

- 1. options, variants
- 2. recursion
- 3. state

NEXT: exceptions?

NEXT: polymorphic (not so simple) typing

## Records

$$\mathsf{t} ::= \dots \{1_{i}=\mathsf{t}_{i}^{i\in 1..n}\}$$
 $\mathsf{t}.1$ 

 $\mathbf{v} ::= \dots \\ \{\mathbf{1}_i = \mathbf{v}_i^{i \in 1..n}\}$ 

 $\mathbf{T} ::= \dots \\ \{\mathbf{1}_i \colon \mathbf{T}_i \stackrel{i \in 1..n}{\rightarrow} \}$ 

terms record projection

values record value

types type of records

#### Evaluation rules for records

$$\{1_i = v_i \stackrel{i \in 1..n}{}\}.1_j \longrightarrow v_j$$
 (E-ProjRcd)

$$\frac{\mathsf{t}_1 \longrightarrow \mathsf{t}_1'}{\mathsf{t}_1, 1 \longrightarrow \mathsf{t}_1', 1} \tag{E-Proj}$$

$$\frac{\mathsf{t}_{j}\longrightarrow\mathsf{t}'_{j}}{\{1_{i}=\mathsf{v}_{i}\ ^{i\in 1..j-1},1_{j}=\mathsf{t}_{j}^{},1_{k}=\mathsf{t}_{k}^{\ k\in j+1..n}\}}\longrightarrow\{1_{i}=\mathsf{v}_{i}\ ^{i\in 1..j-1},1_{j}=\mathsf{t}'_{j}^{},1_{k}=\mathsf{t}_{k}^{\ k\in j+1..n}\}}$$
 (E-RcD)

### Typing rules for records

$$\frac{\text{for each } i \quad \Gamma \vdash \mathbf{t}_i : \mathbf{T}_i}{\Gamma \vdash \{\mathbf{1}_i = \mathbf{t}_i^{-i \in 1..n}\} : \{\mathbf{1}_i : \mathbf{T}_i^{-i \in 1..n}\}} \tag{T-RcD}$$

$$\frac{\Gamma \vdash \mathtt{t}_1 : \{1_i : T_i^{i \in I..n}\}}{\Gamma \vdash \mathtt{t}_1 . 1_i : T_i} \tag{T-Proj}$$

# Sums and variants

#### Sums – motivating example

```
PhysicalAddr = {firstlast:String, addr:String}
VirtualAddr = {name:String, email:String}
Addr = PhysicalAddr + VirtualAddr
inl : "PhysicalAddr → PhysicalAddr+VirtualAddr"
inr : "VirtualAddr → PhysicalAddr+VirtualAddr"

getName = λa:Addr.
case a of
inl x ⇒ x.firstlast
| inr y ⇒ y.name;
```

```
New syntactic forms
t ::= ...
                                           terms
      inl t
                                            tagging (left)
                                             tagging (right)
       inr t
       case t of inl x\Rightarrowt | inr x\Rightarrowt \it case
v ::= ...
                                           values
                                            tagged value (left)
       inl v
                                             tagged value (right)
       inr v
T ::= ...
                                           types
      T+T
                                             sum type
T_1+T_2 is a disjoint union of T_1 and T_2 (the tags inl and inr
ensure disjointness)
```

New evaluation rules

$$\mathtt{t} \longrightarrow \mathtt{t}'$$

case (inl v<sub>0</sub>) 
$$\longrightarrow [x_1 \mapsto v_0] t_1$$
 of inl  $x_1 \Rightarrow t_1 \mid \text{inr } x_2 \Rightarrow t_2$ 

case (inr 
$$v_0$$
)  $\longrightarrow [x_2 \mapsto v_0]t_2$  (E-CaseInr) of inl  $x_1 \Rightarrow t_1$  | inr  $x_2 \Rightarrow t_2$ 

$$\begin{array}{c} t_0 \longrightarrow t_0' \\ \hline \text{case } t_0 \text{ of inl } x_1 \Rightarrow t_1 \text{ | inr } x_2 \Rightarrow t_2 \\ \longrightarrow \text{case } t_0' \text{ of inl } x_1 \Rightarrow t_1 \text{ | inr } x_2 \Rightarrow t_2 \end{array}$$

$$\frac{\mathtt{t}_1 \longrightarrow \mathtt{t}_1'}{\mathtt{inl} \ \mathtt{t}_1 \longrightarrow \mathtt{inl} \ \mathtt{t}_1'} \tag{E-Inl)}$$

$$\frac{\mathtt{t}_1 \longrightarrow \mathtt{t}_1'}{\mathtt{inr} \ \mathtt{t}_1 \longrightarrow \mathtt{inr} \ \mathtt{t}_1'} \tag{E-Inr}$$

New typing rules

$$\Gamma \vdash t : T$$

$$\frac{\Gamma \vdash t_1 : T_1}{\Gamma \vdash \text{inl } t_1 : T_1 + T_2} \tag{T-Inl}$$

$$\frac{\Gamma \vdash t_1 : T_2}{\Gamma \vdash \text{inr } t_1 : T_1 + T_2} \tag{T-INR}$$

$$\frac{\Gamma \vdash \mathtt{t}_0 : T_1 + T_2}{\Gamma, \, \mathtt{x}_1 : T_1 \vdash \mathtt{t}_1 : T \qquad \Gamma, \, \mathtt{x}_2 : T_2 \vdash \mathtt{t}_2 : T}{\Gamma \vdash \mathsf{case} \ \mathtt{t}_0 \ \mathsf{of} \ \mathsf{inl} \ \mathtt{x}_1 \!\!\Rightarrow\!\! \mathtt{t}_1 \ | \ \mathsf{inr} \ \mathtt{x}_2 \!\!\Rightarrow\!\! \mathtt{t}_2 : T} \, \big( T\text{-Case} \big)$$

#### Sums and Uniqueness of Types

Problem:

If t has type T, then inl t has type T+U for every U.

I.e.,

we've lost uniqueness of types.

Possible solutions:

- "Infer" U as needed during typechecking
- Give constructors different names and only allow each name to appear in one sum type (requires generalization to "variants," which we'll see next) — OCaml's solution
- ▶ Annotate each inl and inr with the intended sum type.

For simplicity, let's choose the third.

New syntactic forms

Note that as T here is not the ascription operator that we saw before — i.e., not a separate syntactic form: in essence, there is an ascription "built into" every use of inl or inr.

New typing rules

 $\Gamma \vdash t : T$ 

$$\frac{\Gamma \vdash t_1 : T_1}{\Gamma \vdash \text{inl } t_1 \text{ as } T_1 \text{+} T_2 : T_1 \text{+} T_2} \tag{T-Inl}$$

$$\frac{\Gamma \vdash t_1 : T_2}{\Gamma \vdash \text{inr } t_1 \text{ as } T_1 + T_2 : T_1 + T_2} \tag{T-INR}$$

 $\begin{array}{c} \text{\it Evaluation rules ignore annotations:} & \text{\it $t \to t'$} \\ \\ \text{\it case (inl $v_0$ as $T_0$)} \\ \text{\it of inl $x_1 \Rightarrow t_1$ | inr $x_2 \Rightarrow t_2$} & \text{\it $(E\text{-}CASEINL)$} \\ \\ & \to [x_1 \mapsto v_0]t_1 \\ \\ \text{\it case (inr $v_0$ as $T_0$)} \\ \text{\it of inl $x_1 \Rightarrow t_1$ | inr $x_2 \Rightarrow t_2$} & \text{\it $(E\text{-}CASEINR)$} \\ \\ & \to [x_2 \mapsto v_0]t_2 \\ \\ \hline \\ \frac{t_1 \to t_1'}{\text{inl $t_1$ as $T_2$} \to \text{inl $t_1'$ as $T_2$}} & \text{\it $(E\text{-}INL)$} \\ \\ \hline \\ \frac{t_1 \to t_1'}{\text{inr $t_1$ as $T_2$} \to \text{inr $t_1'$ as $T_2$}} & \text{\it $(E\text{-}INR)$} \\ \\ \hline \end{array}$ 

#### Variants

Just as we generalized binary products to labeled records, we can generalize binary sums to labeled *variants*.

#### New syntactic forms

$$\begin{array}{lll} \textbf{t} & ::= & ... & & \textit{terms} \\ & <1 = t > \text{ as } T & & \textit{tagging} \\ & \text{case } \textbf{t} \text{ of } <1_i = x_i > \Rightarrow \textbf{t}_i \overset{i \in 1..n}{} & & \textit{case} \end{array}$$
 
$$\textbf{T} & ::= & ... & \textit{types} \\ & <1_i : T_i \overset{i \in 1..n}{} > & \textit{type of variants} \end{array}$$

#### Example

```
Addr = <physical:PhysicalAddr, virtual:VirtualAddr>;

a = <physical=pa> as Addr;

getName = \(\lambda a: Addr.\)
    case a of
    <physical=x> \(\Rightarrow x.firstlast
    | <virtual=y> \(\Rightarrow y.name;\)
```

```
Just like in OCaml...

OptionalNat = <none:Unit, some:Nat>;

Table = Nat→OptionalNat;

emptyTable = \( \lambda \text{:Nat.} \) <none=unit> as OptionalNat;

extendTable = \( \lambda \text{:Table.} \) \( \lambda \text{:Nat.} \) \( \lambda \text{:Nat.} \) \( \lambda \text{:Nat.} \) \( \lambda \text{:Nat.} \) if equal n m then <some=v> as OptionalNat else t n;

x = case t(5) of \( < \text{none=u} \rightarrow \rightarrow 999 \) | <some=v> \( \rightarrow \rightarrow ; \)
```

**Options** 

#### Enumerations
